Question 088 | Question bank page 9 | Q.1

Create an ASP.NET Core application to demonstrate Authentication and Authorization.

Project type: ASP.NET MVC / ASP.NET Core

Steps to perform

1. Create the appropriate MVC project in Visual Studio (match the source framework).

2. Add the model, controller and Razor view files in their named folders.

3. Configure routing, dependencies and database/authentication services if needed.

4. Build and launch with Ctrl+F5.

5. Enter test data in the browser and verify the expected response.

Closest supplied practical: } } D) Authentication and Authorization in ASP.NET Core

Source: Dot_Net_Practicals_1_to_5_.pdf

Provided creation instructions and source files

```
Creation steps: Create the ASP.NET Core Web App (MVC) named AuthDemo. Add the listed files at the
locations below
and enter the corresponding code.
Filename: Secret.cshtml    Location: Views/ (MVC view folder)
@{
ViewData["Title"] = "Secret";
}
<h2>Authorized Users Only</h2>
Filename: HomeController.cs    Location: Controllers/HomeController.cs
using Microsoft.AspNetCore.Authorization;
using Microsoft.AspNetCore.Mvc;
namespace AuthDemo.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
        [Authorize]
        public IActionResult Secret()
        {
            return View();
        }
    }
}
Filename: Program.cs    Location: Project root
using AuthDemo.Data;
using Microsoft.AspNetCore.Identity;
using Microsoft.EntityFrameworkCore;
var builder = WebApplication.CreateBuilder(args);
// Add services to the container.
var connectionString = builder.Configuration.GetConnectionString("DefaultConnection")
?? throw new InvalidOperationException(
"Connection string 'DefaultConnection' not found.");
builder.Services.AddDbContext<ApplicationDbContext>(options =>
options.UseSqlServer(connectionString));
builder.Services.AddDatabaseDeveloperPageExceptionFilter();
builder.Services.AddDefaultIdentity<IdentityUser>(options =>
options.SignIn.RequireConfirmedAccount = true)
.AddEntityFrameworkStores<ApplicationDbContext>();
builder.Services.AddControllersWithViews();
var app = builder.Build();
// Configure the HTTP request pipeline.
if (app.Environment.IsDevelopment())
{
    app.UseMigrationsEndPoint();
}
else
{
    app.UseExceptionHandler("/Home/Error");
    app.UseHsts();
}
app.UseHttpsRedirection();
app.UseStaticFiles();
app.UseRouting();
```

```
app.UseAuthorization();
app.MapControllerRoute(
name: "default",
pattern: "{controller=Home}/{action=Index}/{id?}");
app.MapRazorPages();
app.Run();
```

Expected result / verification

The application should meet the exact question requirements. Record actual output or screenshots after running; no execution has been claimed in this manual.
