Provided creation instructions and source files

```
Creation steps: Create the ASP.NET Web Application named StudentRegistration. Add the listed files
at the locations
below and enter the corresponding code.
Filename: StudentForm.aspx.cs    Location: Web Forms project root / code-behind
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.UI;
using System.Web.UI.WebControls;
namespace StudentRegistration
{
    public partial class StudentForm : System.Web.UI.Page
    {
        protected void Page_Load(object sender, EventArgs e)
        {
        }
        protected void btnSubmit_Click(object sender, EventArgs e)
        {
            string gender = "";
            if(rbMale.Checked)
            {
                gender = "Male";
            }
            else if(rbFemale.Checked)
            {
                gender = "Female";
            }
            if (chkTerms.Checked)
            {
                lblOutput.Text = "StudentName :" + txtName.Text +
                "<br/>Gender :" + gender+
                "<br/>Course :" + ddlCourse.SelectedValue +
                "<br/>Date :" + calDate.SelectedDate.ToShortDateString();
            }
            else
            {
                lblOutput.Text = "Please accept Terms & Condition";
            }
        }
    }
}
```

CHECK: This is a related source example, not necessarily a complete or exact solution to the wording above. Adapt and verify it.

Expected result / verification

The application should meet the exact question requirements. Record actual output or screenshots after running; no execution has been claimed in this manual.
